

BETTER WITH CLAUDE INDUSTRIES

M A R K
XLVIII

The ultimate cross-platform personal AI assistant — hears, sees,
understands, and controls your computer by voice.

INSTALLATION GUIDE

WORKS ON

 macOS ·  Windows 10 / 11

PRESENTED BY

Better With Claude

What you'll need

This guide is written for everyone — no coding experience required. Just follow each step in order. The whole setup takes about **15 minutes**. Read this page first, then jump to your platform: 🍏 macOS or 🪟 Windows.

A computer

A Mac (macOS 12 or newer) or a Windows 10 / 11 PC.

Internet connection

Needed to download components and to talk to the AI in real time.

A microphone

Built-in or external. This is a voice assistant — the mic is how you talk to it.

A free Google Gemini key

A free access code from Google. We'll get one together on the next page.

Two simple ideas you'll use a lot. A **Terminal** (Mac) or **PowerShell** (Windows) is just a text window where you type commands — you'll copy & paste them from this guide. A **folder** is the MARK XLVIII folder you received; keep it somewhere easy like your Desktop.

The three stages of setup

A

Get your free Gemini key

A one-time, 2-minute step done in your web browser. Same for Mac and Windows.

B

Install & run the app

Follow the section for **your** computer — 🍏 macOS or 🪟 Windows. Skip the other one.

C

First launch & permissions

Paste your key, allow microphone access, and start talking to your assistant.

Take your time. If a command looks long, that's okay — copy the whole line exactly as shown and paste it in one go. Nothing here can harm your computer.

Get your free Gemini API key

MARK XLVIII runs on Google's Gemini AI. The "API key" is a free, personal access code. You only do this once — the app remembers it afterward.

1 Open Google AI Studio

In any web browser, go to the address below and sign in with your normal Google (Gmail) account.

<https://aistudio.google.com/apikey>

OPEN IN YOUR BROWSER

2 Create the key

Click the “**Create API key**” button. If it asks which project to use, just accept the default one it offers.

3 Copy & keep it safe

A long code appears, starting with AIza.... Click **Copy**. Paste it somewhere safe for a moment (a note, or leave the browser tab open) — you'll need it at first launch.

Treat your key like a password. Don't post it publicly or share it. It's tied to your Google account. If it ever leaks, return to the same page and delete it, then create a new one.

Is it really free? Yes — Google offers a generous free tier that's more than enough for personal everyday use. No credit card is required to start.

✅ Ready to continue

With your key copied, go to the section for your computer:

- 🍏 **Mac users** → next page (Stage B — macOS)
- 📁 **Windows users** → skip ahead to **Stage B — Windows**

Install on a Mac

macOS 12 (Monterey) or newer

Works on both Apple Silicon (M1–M4) and Intel Macs

1 Install Python 3.12

Go to the link below, download the **macOS 64-bit universal installer**, open the downloaded .pkg file, and click through **Continue** → **Install**. This is the engine the app runs on.

<https://www.python.org/downloads/macOS/>

OPEN IN YOUR BROWSER

2 Open the Terminal

Press `⌘ Cmd` + `Space`, type **Terminal**, and press `Return`. A text window opens — this is where you'll paste the next commands.

3 Go into the app folder

Type `cd` and a space, then **drag the MARK XLVIII folder** from your Desktop onto the Terminal window (this pastes its location). Press `Return`.

```
$ cd # then drag the "MARK XLVIII" folder here, then press Return
```

TERMINAL

4 Create a private workspace

This keeps the app's components tidy and separate from the rest of your Mac. Paste this line and press `Return`:

```
$ python3.12 -m venv .venv && source .venv/bin/activate
```

TERMINAL

5 Install the components

Copy the **entire** block below (it's one command) and paste it. This downloads everything the app needs — it may take a few minutes.

```
$ pip install PyQt6 sounddevice google-genai google-generativeai pillow requests beautifulsoup4 duckduckgo-search playwright pyautogui  
pyperclip pygetwindow opencv-python numpy mss psutil send2trash youtube-transcript-api python-pptx fastapi "uvicorn[standard]" cryptography  
python-multipart "qrcode[pil]"
```

6 Add the browser engine

The assistant can browse the web for you. This installs its browser. Paste and press `Return`:

```
$ playwright install chromium
```

TERMINAL

7 Launch MARK XLVIII 🚀

You're ready. Start the assistant with:

```
$ python main.py
```

TERMINAL

The glowing HUD window appears. Continue to **Stage C** (first launch) below.

Coming back later? To run it again another day, you only repeat two lines: open Terminal, `cd` into the folder (steps 2–3), then paste `source .venv/bin/activate && python main.py`. No need to reinstall.

Install on Windows

Windows 10 or Windows 11

Full feature support, including system & window control

1 Install Python 3.12

Go to the link below and download the **Windows installer (64-bit)**. Open it, and — this part is important — tick the box “**Add python.exe to PATH**” at the bottom, then click **Install Now**.

<https://www.python.org/downloads/windows/>

OPEN IN YOUR BROWSER

If you forget the “**Add to PATH**” checkbox, the commands below won't work. Just re-run the installer and tick it.

2 Open PowerShell

Click **Start**, type **PowerShell**, and press **Enter**. A blue text window opens — this is where you'll paste commands.

3 Go into the app folder

Open the MARK XLVIII folder in File Explorer, click the address bar, copy the path, then type `cd` + a space + paste it. Press **Enter**.

```
PS> cd # paste the folder path here, e.g. C:\Users\You\Desktop\MARK XLVIII
```

TERMINAL

4 Create a private workspace

Keeps the app self-contained. Paste and press **Enter**:

```
PS> python -m venv .venv ; .\venv\Scripts\Activate.ps1
```

TERMINAL

If Windows blocks the script with a red “execution policy” message, paste this once, then repeat the line above:
`Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass`

5 Install the components

Copy the **entire** block (one command) and paste it. Note the extra Windows-only items at the end. This can take a few minutes.

```
PS> pip install PyQt6 sounddevice google-genai google-generativeai pillow requests beautifulsoup4 duckduckgo-search playwright pyautogui  
pyperclip pygetwindow opencv-python mss psutil send2trash youtube-transcript-api python-pptx fastapi "uvicorn[standard]" cryptography  
python-multipart "qrcode[pil]" comtypes pycaw win10toast pywinauto
```

6 Add the browser engine

Lets the assistant browse the web. Paste and press **Enter**:

```
PS> playwright install chromium
```

TERMINAL

7 Launch MARK XLVIII 🚀

All set. Start it with:

```
PS> python main.py
```

TERMINAL

The HUD appears. Continue to **Stage C** (first launch) below.

Coming back later? Reopen PowerShell, `cd` into the folder, then paste `.\venv\Scripts\Activate.ps1 ; python main.py`. No reinstalling needed.

Bring JARVIS online

The first time the app opens, it asks for your Gemini key and your computer's permission to hear and see. This happens only once.

1 Paste your Gemini key

On the welcome screen, paste the AIza... key you copied in Stage A and confirm. The app saves it securely inside the folder for next time.

2 Allow microphone (and camera/screen)

🍏 **Mac:** when prompted, click **Allow**. For voice/vision features also open System Settings → Privacy & Security and enable **Microphone**, **Screen Recording**, and **Accessibility** for Terminal.

🪟 **Windows:** if a firewall or mic prompt appears, choose **Allow**.

3 Say hello 🗨️

Start speaking naturally, or type in the input bar. Try “What time is it?” or “Open my browser”. Press **Esc** any time to interrupt the assistant.

🔧 If something goes wrong

WHAT YOU SEE	WHAT TO DO
<code>python: command not found</code> / not recognized	Python isn't installed or wasn't added to PATH. Re-run the Python installer (Windows: tick “Add to PATH”). On Mac, use <code>python3.12</code> instead of <code>python</code> .
<code>ModuleNotFoundError: No module named ...</code>	One component didn't install. Make sure your workspace is active (you should see <code>(.venv)</code> at the start of the line), then run <code>pip install <name></code> using the name shown in the message.
Red “execution policy” error (Windows)	Paste <code>Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass</code> , press Enter, then retry the previous command.
The assistant can't hear me	Check the microphone permission (Stage C, step 2) and that the correct mic is selected in your system sound settings.
“API key not valid” message	The key was pasted incompletely. Recopy the full <code>AIza...</code> code from AI Studio and enter it again.
Nothing happens / window won't open	Confirm the workspace is active (<code>(.venv)</code> visible), you're inside the <code>MARK XLVIII</code> folder, then re-run <code>python main.py</code> .

🎉 You're all set

MARK XLVIII is now your voice-driven AI companion — it can search the web, control your computer, watch your screen, remember your preferences, and more.

To relaunch anytime: open your terminal → **go into the folder** → **activate the workspace** → `python main.py`.
